

Exploratory Data Analysis on the Automobile Dataset

Report

Introduction

This dataset tracks differences in components across car manufacturers. It contains 205 data points with 24 columns

Data cleaning

Determining values that are not used in the analysis and removing them. The duplicated values are also removed. Data with numbers but were listed as strings or floats were converted into integer values.

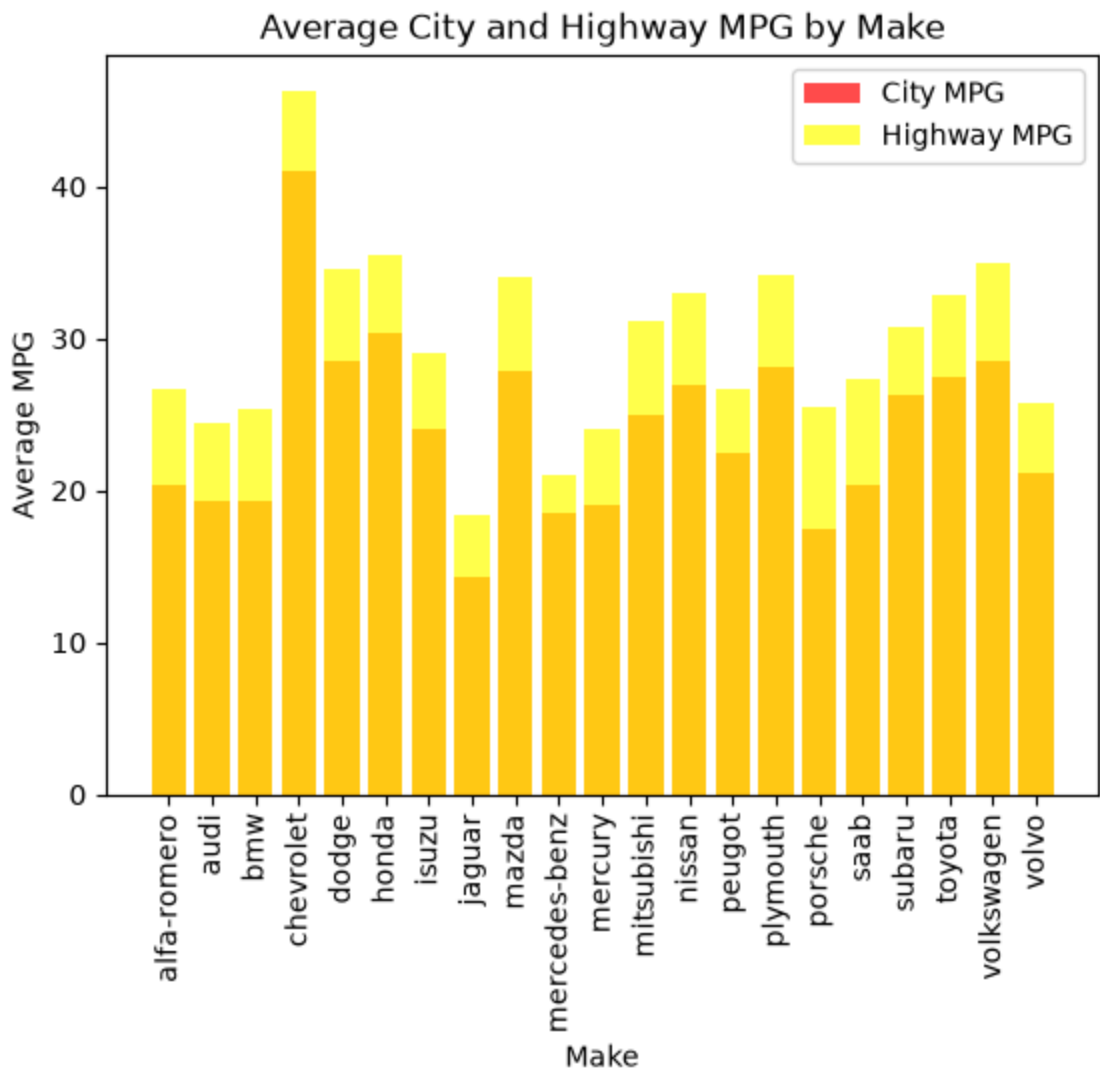

Missing data

Data with missing values were completely removed from the dataset.

Data stories and visualisations

The data provided compares the factors across car manufacturers. Each manufacturer has a component that they value more than the other. Components such as engine size or type, fuel capacity and efficiency, horsepower, etc. Cars with higher price values tend to have lower fuel efficiency and vice versa. Those with a bigger engine have higher horsepower. There are outliers like the Chevrolet that has a model with the smallest engine size, but on average, this

manufacturer has the best fuel efficiency.
